

Content

Module 5: FEM for Two and Three Dimensional Solids (08)

Lecture 1: Constant Strain Triangle(Page:1-6)

5.1.1 Element Stiffness Matrix for CST

5.1.2 Nodal Load Vector for CST

Lecture 2: Linear Strain Triangle(Page:7-12)

5.2.1 Element Stiffness Matrix for LST

5.2.2 Nodal Load Vector for LST

5.2.3 Numerical Example using CST

Lecture 3: Rectangular Elements(Page:13-19)

5.3.1 Computation of Element Stiffness

5.3.2 Computation of Nodal Loads

Lecture 4: Numerical Evaluation of Element Stiffness(Page:20-30)

5.4.1 Numerical Example

5.4.2 Evaluation of Stiffness using One Point Gauss Quadrature

5.4.3 Evaluation of Stiffness using Two Point Gauss Quadrature

Lecture 5: Computation of Stresses, Geometric Nonlinearity and Static Condensation(Page:31-38)

5.5.1 Computation of Stresses

5.5.2 Geometric Nonlinearity

5.5.2.1 Steps to include effect of geometrical nonlinearity

5.5.3 Static Condensation

Lecture 6: Axisymmetric Element(Page:39-45)

5.6.1 Introduction

5.6.2 Relation between Strain and Displacement

5.6.3 Relation between Stress and Strain

5.6.4 Axisymmetric Shell Element

Lecture 7: Finite Element Formulation of Axisymmetric Element(Page:45-52)

5.7.1 Stiffness Matrix of a Triangular Element

5.7.2 Stiffness Matrix of a Quadrilateral Element

Lecture 8: Finite Element Formulation for 3 Dimensional Elements(Page:53-59)

5.8.1 Introduction

5.8.2 Strain Displacement Relation 5.8.3 Element Stiffness Matrix

5.8.4 Element Load Vector

5.8.4.1 Gravity load

5.8.4.2 Surface pressure

5.8.5 Stress Computation

Worked out Examples(Page:60-61)

Example 5.1 Calculation of nodal loads on a triangular element
